

ASSIGNMENT- 12.5

Name: Kaveti Sreenavya

HT.No: 2303A51244

Batch: 19

Task 1: Merge Sort Implementation.

Implement Merge Sort using AI assistance. Include time and space complexity in the docstring and verify with test cases.

Prompt: # Generate a Python function `merge_sort(arr)` that sorts a list in ascending order. Include time complexity and space complexity in the docstring.

Code:

```
1  #Task 1 - Merge Sort Implementation
2  def merge_sort(arr):
3      if len(arr) <= 1:
4          return arr
5
6      mid = len(arr) // 2
7      left = merge_sort(arr[:mid])
8      right = merge_sort(arr[mid:])
9
10     return merge(left, right)
11
12
13 def merge(left, right):
14     sorted_list = []
15     i = j = 0
16
17     while i < len(left) and j < len(right):
18         if left[i] < right[j]:
19             sorted_list.append(left[i])
20             i += 1
21         else:
22             sorted_list.append(right[j])
23             j += 1
24
25     sorted_list.extend(left[i:])
26     sorted_list.extend(right[j:])
27
28     return sorted_list
29
30
31 arr = [38, 27, 43, 3, 9, 82, 10]
```

Result:

```
PS C:\Users\v1\OneDrive\Desktop\AI Coding-2026> & "C:/Program Files/Python311/python.exe" "c:/Users/
Sorted Array: [3, 9, 10, 27, 38, 43, 82]
PS C:\Users\v1\OneDrive\Desktop\AI Coding-2026>
```

Observation:

Merge Sort guarantees $O(n \log n)$ time complexity in all cases. It is stable and suitable for large datasets. However, it requires extra space for merging.

Task 2: Binary Search

Implement binary search for sorted lists with complexity explanation.

Prompt: # Generate a Python function

binary_search(arr, target) that returns index or

Include best, average, worst-case complexities in

docstring.

Code :

```
35 #Task 2 - Binary Search
36 def binary_search(arr, target):
37     """
38     Performs Binary Search on sorted list.
39
40     Best Case: O(1)
41     Average Case: O(log n)
42     Worst Case: O(log n)
43     Space Complexity: O(1)
44     """
45     low = 0
46     high = len(arr) - 1
47
48     while low <= high:
49         mid = (low + high) // 2
50
51         if arr[mid] == target:
52             return mid
53         elif arr[mid] < target:
54             low = mid + 1
55         else:
56             high = mid - 1
57
58     return -1
59
60
61 arr = [1, 3, 5, 7, 9, 11]
62 print(binary_search(arr, 7))
63
```

Result:

```
PS C:\Users\v1\OneDrive\Desktop\AI Coding-2026> & "C:/Program Files/Python311/python.exe" "c:/Users/v1/OneDrive/Desktop/AI Coding-2026/12-05.py"
Sorted Array: [3, 9, 10, 27, 38, 43, 82]
3
PS C:\Users\v1\OneDrive\Desktop\AI Coding-2026>
```

Observation:

Binary Search reduces search space by half each iteration, making it highly efficient for sorted datasets.

Task 3: Healthcare Appointment Scheduling

Search appointments by ID and sort by consultation fee.

Prompt: # Recommend and implement efficient search and sorting for appointment records..

Code:

```
63
64 #Task 3 - Healthcare Appointment Scheduling
65 appointments = [
66     {"id": 101, "patient": "A", "fee": 500},
67     {"id": 102, "patient": "B", "fee": 300},
68     {"id": 103, "patient": "C", "fee": 700}
69 ]
70
```

Result:

```
Sorted Array: [5, 9, 10, 27, 38, 43, 82]
3
Sorted by Fee: [{"id": 102, 'patient': 'B', 'fee': 300}, {'id': 101, 'patient': 'A', 'fee': 500}, {'id': 103, 'patient': 'C', 'fee': 700}]
PS C:\Users\vl\OneDrive\Desktop\AI Coding-2026>
```

Observation:

Sorting by fee helps prioritize billing. Efficient searching ensures quick appointment retrieval.

Task 4: Railway Reservation System

Search tickets by ID and sort by seat number.

Prompt: # Implement search and sorting for railway booking system.

Code:

```
Assign12.5.py > ...
75
76 #Task 4 - Railway Reservation System
77 tickets = [
78     {"ticket_id": 1, "seat": 12},
79     {"ticket_id": 2, "seat": 5},
80     {"ticket_id": 3, "seat": 20}
81 ]
82
83 sorted_tickets = sorted(tickets, key=lambda x: x["seat"])
84 print(sorted_tickets)
```

Result:

```
3
Sorted by Fee: [{'id': 102, 'patient': 'B', 'fee': 300}, {'id': 101, 'patient': 'A', 'fee': 500}, {'id': 103, 'patient': 'C', 'fee': 700}]
[{'ticket_id': 2, 'seat': 5}, {'ticket_id': 1, 'seat': 12}, {'ticket_id': 3, 'seat': 20}]
PS C:\Users\vl\OneDrive\Desktop\AI Coding-2026>
```

Observation

Sorting by seat helps structured allocation. Efficient searching speeds up ticket retrieval.

Task 5: Hostel Room Allocation.

Search by student ID and sort by room number.

Prompt: # Suggest and implement optimized search and sort for hostel allocation system.

Code:

```
Assign12.5.py > ...
86 #Task 5 - Hostel Room Allocation
87 rooms = [
88     {"student_id": 101, "room": 12},
89     {"student_id": 102, "room": 5},
90     {"student_id": 103, "room": 20}
91 ]
92
93 sorted_rooms = sorted(rooms, key=lambda x: x["room"])
94 print(sorted_rooms)
```

Result:

```
3
Sorted by Fee: [{'id': 102, 'patient': 'B', 'fee': 300}, {'id': 101, 'patient': 'A', 'fee': 500}, {'id': 103, 'patient': 'C', 'fee': 700}]
[{'ticket_id': 2, 'seat': 5}, {'ticket_id': 1, 'seat': 12}, {'ticket_id': 3, 'seat': 20}]
[{'student_id': 102, 'room': 5}, {'student_id': 101, 'room': 12}, {'student_id': 103, 'room': 20}]
PS C:\Users\v1\OneDrive\Desktop\AI Coding-2026>
```

Observation:

Sorting organizes room allocation efficiently. Binary search enables fast record lookup.

Task 6: Online Movie Streaming Platform

Search by movie ID and sort by rating.

Prompt: # Implement searching and sorting for movie platform.

Code:

```

Assign12.5.py > ...
96 #Task 6 – Online Movie Streaming Platform
97 movies = [
98     {"id": 1, "rating": 8.5},
99     {"id": 2, "rating": 9.2},
100    {"id": 3, "rating": 7.8}
101 ]
102

```

Result:

```

Sorted Array: [3, 9, 10, 27, 30, 43, 62]
3
Sorted by Fee: [{'id': 102, 'patient': 'B', 'fee': 300}, {'id': 101, 'patient': 'A', 'fee': 500}, {'id': 103, 'patient': 'C', 'fee': 700}]
[{'ticket_id': 2, 'seat': 5}, {'ticket_id': 1, 'seat': 12}, {'ticket_id': 3, 'seat': 20}]
[{'student_id': 102, 'room': 5}, {'student_id': 101, 'room': 12}, {'student_id': 103, 'room': 20}]
[{'id': 2, 'rating': 9.2}, {'id': 1, 'rating': 8.5}, {'id': 3, 'rating': 7.8}]
PS C:\Users\vl\OneDrive\Desktop\AI Coding-2026>

```

Observation:

Sorting by rating improves recommendation systems. Efficient search helps retrieve movies quickly.

Task 7: Task 7 – Agriculture Crop Monitoring

Search crop data by ID and sort by moisture level.

Prompt: # Implement search and sort for agriculture monitoring system.

Code:

```

#Task 7 – Agriculture Crop Monitoring
crops = [
    {"id": 1, "moisture": 30},
    {"id": 2, "moisture": 45},
    {"id": 3, "moisture": 25}
]

```

Result:

```

orted by Fee: [{'id': 102, 'patient': 'B', 'fee': 300}, {'id': 101, 'patient': 'A', 'fee': 500}, {'id': 103, 'patient': 'C', 'fee': 700}]
[{'ticket_id': 2, 'seat': 5}, {'ticket_id': 1, 'seat': 12}, {'ticket_id': 3, 'seat': 20}]
[{'student_id': 102, 'room': 5}, {'student_id': 101, 'room': 12}, {'student_id': 103, 'room': 20}]
[{'id': 2, 'rating': 9.2}, {'id': 1, 'rating': 8.5}, {'id': 3, 'rating': 7.8}]
[{'id': 3, 'moisture': 25}, {'id': 1, 'moisture': 30}, {'id': 2, 'moisture': 45}]
S. C:\Users\vl\OneDrive\Desktop\AI Coding-2026>

```

Observation:

Sorting by moisture helps prioritize irrigation. Efficient search improves crop monitoring.

Task 8: Task 8 – Airport Flight Management

Search flight details by ID and sort by departure time.

Prompt: # Implement searching and sorting for airport flight system.

Code:

```
#Task 8 – Airport Flight Management
flights = [
    {"id": 1, "departure": "10:30"},
    {"id": 2, "departure": "08:15"},
    {"id": 3, "departure": "12:45"}
]

sorted_flights = sorted(flights, key=lambda x: x["departure"])
print(sorted_flights)
```

Result:

```
Sorted Array: [3, 9, 10, 27, 38, 43, 82]
3
Sorted by Fee: [{'id': 102, 'patient': 'B', 'fee': 300}, {'id': 101, 'patient': 'A', 'fee': 500}, {'id': 103, 'patient': 'C', 'fee': 700}]
[{'ticket_id': 2, 'seat': 5}, {'ticket_id': 1, 'seat': 12}, {'ticket_id': 3, 'seat': 20}]
[{'student_id': 102, 'room': 5}, {'student_id': 101, 'room': 12}, {'student_id': 103, 'room': 20}]
[{'id': 2, 'rating': 9.2}, {'id': 1, 'rating': 8.5}, {'id': 3, 'rating': 7.8}]
[{'id': 3, 'moisture': 25}, {'id': 1, 'moisture': 30}, {'id': 2, 'moisture': 45}]
[{'id': 2, 'departure': '08:15'}, {'id': 1, 'departure': '10:30'}, {'id': 3, 'departure': '12:45'}]
PS C:\Users\v1\OneDrive\Desktop\AI Coding-2026>
```

Observation:

Sorting by departure ensures correct scheduling order. Efficient search helps retrieve flight details instantly
